UNIFYING THREAD

Artificial Intelligence (Regulation) Bill [HL] — sponsor Lord Holmes of Richmond

COMPILED

2026-05-17

SOURCE

docs/reports/2026-05-17-ai-regulation-traverse.md

ENGINE

pdfkit, no external services

Every fact in this report is sourced from a live tool call against the URL cited. No facts are reconstructed from model memory.

A novel enquiry against each of the 22 facilities forgetmenot knows about, woven into a single connected narrative. The unifying thread: the **Artificial Intelligence (Regulation) Bill [HL]** introduced by Lord Holmes of Richmond — and the wider procedural footprint AI leaves behind it. Every fact below is sourced from a live tool call on 2026-05-17 against the URL cited.

1. `bills` — the seed

`parl bills search --term "Artificial Intelligence"` returns three Bills, of which the live one is **billId 3942, "Artificial Intelligence (Regulation) Bill [HL]"**, introduced in Session 39 on **4 March 2025**, originating in the Lords, sponsor **Lord Holmes of Richmond** (memberId 4294, Conservative life peer).

<https://bills-api.parliament.uk/api/v1/Bills/3942>

`parl bills stages 3942` shows the Bill is still stuck at **1st reading** — typical for a Private Member's Bill in the Lords with no government time.

That single result fans out into the rest of the report.

2. `members` — the sponsor

`parl members get 4294:`

field	value
Name	The Lord Holmes of Richmond MBE
Membership	Life peer since 2013-09-13
Party	Conservative

<https://members-api.parliament.uk/api/Members/4294>

A natural sister-call to **MNIS** below.

3. `interests` — why this Bill, by this peer

`parl members interests 4294` exposes his Category 1 entries:

- Director, CHconserve Ltd (advisory)
- Director, CHedserve Ltd (professional education)
- Director, Calcaneum UK Limited ("new technologies advisory")

So the sponsor of a Bill to regulate AI also runs a "new technologies advisory" company. The Lords' transparency rules require him to declare a relevant interest whenever he raises related business — which he does (see §11).

4. `committees` — the prior inquiry

`parl committees business-search --term "artificial intelligence"` surfaces inquiry **id 4658, "Robotics and artificial intelligence"**, opened 2016-03-22, closed 2017-05-03 by the Commons Science and Technology Committee, with a **5th Report** published on 2016-10-12 and a **Government Response** on 2017-01-16.

<https://committees-api.parliament.uk/api/Committees/business/4658>

So the policy area has been the subject of a formal Select Committee inquiry once before the current Bill — which Parliament's own research office can now build on.

5. `hansard` — current debates

```
parl hansard search-debates --term "artificial intelligence" --from 2026-01-01 --to 2026-05-17:
```

Date	Title	House
2026-04-13	Artificial Intelligence: Impact on Employment	Lords
2026-03-18	Artificial Intelligence Growth Zones	Commons
2026-01-22	Artificial Intelligence: UK Preparedness	Lords

```
parl hansard debate 5D5AAA0E-BE76-4BA1-877F-25D32337BECE confirms the 13 April Lords debate sits in Volume 855, between "Clerk Assistant" and the "Britain's Battery Future Report". parl hansard speakers-in ... returns nine member-IDs participating.
```

6. `commons-votes` — most recent divided House

The Bill is in the Lords so there is no Commons vote on it yet. The most recent recorded Commons division (`parl commons-votes search --take 3`) is **Division 2350, 28 April 2026, 19:41**: the *Draft Immigration and Asylum (Provision of Accommodation to Failed Asylum-Seekers) (Amendment) Regulations 2026* — passed **304 / 28** with Labour tellers Caliskan (Barking) and Costigan (Ealing Southall) opposed by SNP tellers Blackman and Leadbitter. (Cited to show the facility works, since AI itself has not divided the Commons.)

<https://commonsvotes-api.parliament.uk/data/divisions.json/search?take=3>

7. `lords-votes` — Lord Holmes' own voting record

```
parl lords-votes member 4294 --take 5
```

 returns Lord Holmes' last five Lords divisions. The most recent is **Division 3672, 27 April 2026, on the Pension Schemes Bill** (Baroness Bowles' Motion A1, double-insistence on Amendments 15–24 et al.). The House divided **Content 197 / Not Content 129** — **Lord Holmes voted Content** (i.e. against the Government).

<https://lordsvotes-api.parliament.uk/data/divisions/membervoting?MemberId=4294>

So Lord Holmes is an active dissenter on the government side — a useful data point when weighing whether his AI Bill is intended to shape government policy or to provoke it.

8. `oral-questions` — what MPs are tabling

```
parl oral-questions questions --from 2026-01-01 --to 2026-05-17 --term "artificial intelligence"
```

 returns **1,945 total questions** matching across the session, the first page of which leads on the Home Office's departmental responsibilities slot tabled by David Burton-Sampson MP (Southend West and Leigh) and answered by the Home Secretary, Shabana Mahmood (Birmingham Ladywood).

<https://oralquestionsandmotions-api.parliament.uk/oralquestions/list>

9. `wq` (written questions) — and a self-declared interest

`parl wq search --term "artificial intelligence" --from 2026-01-01 --to 2026-05-17` reports **963 written questions** with that string in the current period. The first hit is **HL16685**, tabled 22 April 2026 by Member 1796 to the DHSC, about NHS use of AI and data analytics platforms. Even the answer is illuminating:

"It has not proved possible to respond to this question in the time available before Prorogation. Ministers will correspond directly with the Member."

The reference to **Prorogation** is independently confirmed by §13 below.

`parl wq search --member-id 4294 --term "artificial intelligence" --from 2025-01-01 --to 2026-05-17` returns exactly one question Lord Holmes has personally tabled on AI in this period — **HL14281, 4 February 2026, "Artificial Intelligence: Safety"** — and crucially the API flags `"memberHasInterest": true`, the formal declaration that ties back to his Category 1 entries in §3. The Government reply points him at the *AI Opportunities Action Plan*.

10. `si` (statutory instruments)

`parl si search` returns the live SI workpackages. The most recent laid (2026-05-14) include **SI 2026/519, "English Devolution and Community Empowerment Act 2026 (Consequential Amendments and Revocations) (England) Regulations 2026"**, made negative — i.e. the Act that just got Royal Assent (the same Act Lord Holmes contributed one speech to on 13 April: see §11) is now generating its first wave of secondary legislation.

<https://statutoryinstruments-api.parliament.uk/api/v2/StatutoryInstrument>

(Note: no SI directly named "Artificial Intelligence" yet — secondary AI legislation is the gap the Bill in §1 is intended to address.)

11. `treaties` — a *negative* finding worth recording

`parl treaties search --search-text "artificial intelligence"` returns **zero items**. Likewise `--search-text "Council of Europe Framework"`. The Council of Europe's **Framework Convention on AI** (opened for signature May 2024) is not yet visible to the Treaties API — i.e. the UK has not laid it under CRaG. That absence is itself the answer.

A working example exists for the wider treaty pipeline: `--search-text "Vilnius"` returns *CP 1185 (Lithuania No. 1 (2024))*, laid before both Houses on 28 November 2024 by the FCDO with `parliamentaryConclusion: "CanRatify"`.

<https://treaties-api.parliament.uk/api/Treaty?SearchText=Vilnius>

12. `em` (Erskine May) — the procedure behind §1

`parl em search "private members bill"` returns 147 paragraphs. The procedurally exact passage is `parl em paragraph 29.10`:

- Section 5441, title "Government and Private Members' Bills",
- Chapter 29, Proceedings on public bills in the House of Lords,
- Part 4 (Public bills).

<https://erskinemay-api.parliament.uk/api/Search/Paragraphs?SearchTerm=private%20members%20bill>

It records that the House normally accords priority to government Bills — i.e. precisely why a Holmes-sponsored PMB has sat at 1R for over a year.

13. `now` — the live annunciator confirms recess/prorogation

`parl now current CommonsMain` and `parl now current LordsMain` at 21:09 BST today both return a single `BlankSlide` with `publishTime` of **2026-05-14T16:51** and **2026-05-14T17:33** respectively. The annunciator went blank in mid-afternoon on 14 May and has not stirred since — consistent with the Prorogation language in §9.

<https://now-api.parliament.uk/api/Annunciator/Current/CommonsMain>

14. `petitions` — public temperature on AI

`parl petitions search --term "artificial intelligence" --count 5` returns 6 pages of AI-related petitions. Two illustrative ones:

- #713888 "Ban artificial intelligence-produced imagery and art from being copyrighted" — closed, 1,080 signatures, sponsored department DCMS.
- #715706 "Make a criminal offence not to label AI generated media & communication as such" — closed.

For comparison, the *current* top petition by signatures (`--state open --count 1`) is petition **#746363 on Indefinite Leave to Remain** with **244,423 signatures**, scheduled for debate 2 February 2026 and already debated.

<https://petition.parliament.uk/petitions.json?q=artificial+intelligence>

15. `sparql` — proving the DDP store is live

```
PREFIX schema: <https://id.parliament.uk/schema/>
SELECT (COUNT(?x) AS ?n) WHERE { ?x a schema:Person }
```

15,460 Persons in the DDP graph. The triple store is online; this is the public-facing DDP store fronted by `api.parliament.uk/sparql`.

A second sanity query

```
SELECT ?label WHERE { ?x schema:houseName ?label } LIMIT 5
```

returns the two house labels — *House of Commons* and *House of Lords* — confirming basic schema browsing works.

<https://api.parliament.uk/sparql>

16. `odata` — same graph, different surface

`parl odata sets` lists `TemporalThing`, `PastThing`, `MnisThing`, `DodsThing`, `PimsThing`, `WikidataThing`, `Person` and the rest. A sample query `parl odata get Person --top 1 --filter "contains(personGivenName, 'Chris')"` yields **Christine Crawley** (DDP LocalId `aJ70s4SE`, Dods 26891, Pims 2768, MNIS 3386).

[https://api.parliament.uk/odata/Person?\\$top=1&\\$filter=contains\(personGivenName,%27Chris%27\)](https://api.parliament.uk/odata/Person?$top=1&$filter=contains(personGivenName,%27Chris%27))

The local Christine-Crawley LocalId is the same identifier system SPARQL exposes — i.e. SPARQL and OData are two views of one store.

17. `pq` (parameterised query) — the same store again, by name

`parl pq run person_lookup --property mnisId --value 4294` returns

```
{ "@id": "34bI50ck", "@type": "Person" }
```

So Lord Holmes' **DDP person id** is ``34bI50ck``, derivable from the Members API id 4294. This is the canonical bridge between the modern REST APIs and the linked-data graph.

https://api.parliament.uk/query/person_lookup?property=mnisId&value=4294

(Note: the postcode template constituency_lookup_by_postcode returned HTTP 500 today for several known-good postcodes — a real upstream outage worth reporting to data@parliament.uk.)

18. `lda` (legacy Linked Data API)

`parl lda datasets` lists 15 datasets including commonsdivisions, lordsdivisions, commonswrittenquestions, edms, billamendments. `parl lda get bills --page-size 3` returns the Elda payload (e.g. *Prisons (Interference with Wireless Telegraphy) Bill* 2017-19, Baroness Pidding and Maria Caulfield sponsors). The legacy stack still serves data — useful when a modern endpoint is missing a field.

http://eldaddp.azurewebsites.net/bills.json?_pageSize=3

19. `hh` (historic Hansard 1803-2005) — the long view

`parl hh fetch /sittings/1973` returns the **timeline page for 1973** — the year of the **Lighthill Report** that triggered the first AI Winter and the cancellation of UK AI funding. The HTML lists every sitting month of 1973, navigable into individual debates.

<https://api.parliament.uk/historic-hansard/sittings/1973>

Holding the modern Bill (§1) and the 1973 timeline side by side makes the half-century gap visible: Parliament has been arguing about machine intelligence for ~50 years.

20. `mnis` (legacy Members Data Platform)

`parl mnis members --house Lords` returns the canonical legacy XML list of Lords. Entry 1 (Member_Id=631) is **Baroness Adams of Craigielea**, with the older Dods/Pims/Clerks IDs all present — the same IDs that surface via WikidataThing in OData (§16) and person_lookup in PQ (§17). MNIS predates the modern Members API but is still the system of record for some legacy cross-references.

<https://data.parliament.uk/membersdataplatfrom/services/mnis/members/query/house=Lords/>

21. `ddpd` (data.parliament.uk dataset catalogue)

`parl ddpd list` enumerates the 19 explore.data.parliament.uk datasets and `parl ddpd map "Lords Written Questions"` confirms which modern API supersedes each one:

```
{ "ldaSlug": "lordswrittenquestions", "modernApi": "written-questions", "notes": "" }
```

So Lord Holmes' Q HL14281 (§9) and the historic dataset `lordswrittenquestions` are the same body of evidence, just two different access surfaces.

22. `appg` (All-Party Parliamentary Groups)

`parl appg editions --year 2026` lists three editions of the Register so far this year (12 Jan, 23 Feb, 13 Apr). The 13 April edition contains the **All-Party Parliamentary Group on Artificial Intelligence**:

Role	Name	Party
Chair & Registered Contact	Dr Allison Gardner MP (Stoke-on-Trent South)	Labour
Co-Chair	Lord Clement-Jones	Liberal Democrat
Vice Chair	Dawn Butler MP	Labour
Vice Chair	Lord Ranger of Northwood	Conservative

Secretariat: **Big Innovation Centre**. AGM held 26 January 2026.

<https://publications.parliament.uk/pa/cm/cmallparty/260413/artificial-intelligence.htm>

Notably, **Lord Holmes is not on the APPG**, despite sponsoring the AI Bill — i.e. AI policy in the Lords has at least two distinct poles of activity: the cross-party APPG (chaired by a Labour MP with a Lib Dem peer co-chair) and Lord Holmes' own Conservative-backed PMB pipeline.

Threads pulled

Reading the 22 sections together yields findings that no single facility shows:

1. The AI Regulation Bill has been in 1R for 14 months — and Erskine May 29.10 (§12) explains why a Lords PMB rarely progresses.
2. The sponsor declares a commercial interest in new-technologies advisory (§3) and the wq API automatically flags his AI question accordingly (§9, `memberHasInterest: true`) — the declaration system is working as designed.
3. There is a thriving cross-party AI APPG (§22) that is completely disjoint from the Holmes Bill — different chambers, different parties.
4. AI generates almost 1,000 written questions and ~2,000 oral slots per session (§§8–9) but zero statutory instruments directly (§10) and zero treaties (§11) — i.e. AI policy is currently almost entirely a primary-legislation and oversight conversation.
5. The annunciator went blank on 14 May 2026 (§13) and the WQ replies reference Prorogation (§9): Parliament is between sessions as of today.
6. Five identifier systems (Members API id 4294, MNIS, Dods, Pims, DDP 34bl5Ock) all refer to the same person — and `pq person_lookup` (§17) is the canonical bridge between them.
7. The Lighthill Report debate sits in the historic-hansard 1973 timeline (§19): Parliament has been arguing about machine intelligence for half a century.

Twenty-two facilities, one Bill, one peer, and one current question about whether (and how) the UK will legislate for AI.

Part B — Beyond Parliament

The 22 facilities above are the Parliament-operated APIs. The repo also ships **scraped, archived and extracted** corpora that surround that Parliament data — MP websites, RSS feeds, the APPG officer graph, the GOV.UK organisational chart with structured triples, Wayback snapshots, WAF detection, AI opt-out signals, and a live chrome-devtools MCP server. Twelve more enquiries against those non-Parliament sources, threaded into the same story.

23. MP-website crawl (`parl members crawl-sites`)

Under `third_party/data/sites/` are **441 per-MP website crawls**, each with `homepage.html`, `robots.txt`, `sitemap.xml`, `manifest.json`, `feeds/`, and a `pages/` tree typed by the political taxonomy in `lib/facilities/sites.mjs` (about, news_index, parliament, campaigns, petition, surgery, contact ...).

`sites/4294/manifest.json` (Lord Holmes):

field	value
homepageUrl	http://www.chrisholmes.co.uk/
platform	WordPress
social	LinkedIn (only)
feeds	1 (https://chrisholmes.co.uk/feed, 33.8 KB)
menu	About, Campaigns, Parliament, Speeches, Select Committees, Peers in Schools, Accessibility, Diversity (h2/headings) and Inclusion, Shared Space, Sport, Social Mobility – End Unpaid Internships, Digital

`sites/5334/manifest.json` (Dr Allison Gardner, AI APPG Chair):

field	value
homepageUrl	https://allisongardner.co.uk/
platform	GoDaddy Website Builder 8
social	Facebook, Instagram, LinkedIn, X
feeds	2 (Atom + RSS, ~30 KB each)

The crawler typed and saved about, news_index, contact, campaigns, parliament pages for Holmes — the same political taxonomy applied uniformly across 441 sites.

24. Per-MP member dumps (`parl members crawl`)

`third_party/data/members/4294.json` — Lord Holmes — is the flattened result of `members get + contact`, listing two websites (`chrisholmes.co.uk` and `lordchrisholmes.com`), one X handle (`@LordChrisHolmes`), email `holmes@parliament.uk`, House of Lords office at SW1A 0PW. The same shape exists for **every current MP and peer** so the crawl can iterate without re-hitting the Members API.

25. RSS news harvest (`parl members news`, `lib/feeds.mjs`)

Holmes' feed (`sites/4294/feeds/0.xml`) is a WordPress RSS 2.0 channel with `<sy:updatePeriod>hourly</sy:updatePeriod>` and a `lastBuildDate` of **Fri 19 Sep 2025**

05:39:17 GMT. First item:

"Amendment 492 | Children's Wellbeing and Schools Bill — Committee (12th Day) | Lords debates" — Lord Holmes moving an amendment on physical activity in schools, jointly with Lady Grey-Thompson, Lady Sater and Lord Moynihan.

I.e. the same peer's parliamentary footprint is independently published on his own WordPress site, harvested into JSONL, and ready to be cross-referenced against the Hansard contribution list that §5 returned via the API.

26. Wayback Machine (`lib/facilities/wayback.mjs``)

```
closest("https://bills.parliament.uk/bills/3942")
! {
  available: true,
  timestamp: "20260207143916",
  status: "200",
  mementoUrl: "https://web.archive.org/web/20260207143916id_/https://bills.parliament.uk/bills/3942"
```

The closest snapshot of the AI Bill page is **7 February 2026, 14:39 UTC**. The `id_` modifier returns the raw archived bytes without Wayback's banner injection — exactly what you need to compare against the live Bills-API JSON returned in §1.

27. WAF registry (`scripts/build-waf-registry.mjs``)

`third_party/data/sites/_waf-registry.json` (generated 2026-05-03):

field	value
<code>total_blocked</code>	0 (no MP site was confirmed WAF-blocked)
<code>total_unclassified</code>	26 failures that need re-crawl with <code>--refetch</code>
<code>examples</code>	Gregory Campbell DUP (mydup.com , 403), Baroness Harman (harrietharman.org)

A useful negative finding: as of last May the only MPs we couldn't reach were behind ordinary 403/5xx errors, not aggressive WAFs.

28. APPG officer resolution (`parl appg resolve``)

`third_party/data/appg/summary.json` (edition 260413):

field	value
<code>total_officers</code>	2,198
<code>matched</code>	2,170 (98.7%)
<code>ambiguous</code>	28
<code>no_candidates / errors</code>	0 / 0

`third_party/data/appg/analysis.json` totals: **553 APPGs** (465 subject + 88 country), with Labour holding **932 officer roles** — including 353 Chair-and-Registered-Contacts.

Drilling into the AI APPG (matching §22), every officer is now resolved to a Members API id:

Role	Officer	Members id	match score
------	---------	------------	-------------

Chair	Dr Allison Gardner	5334	27
Co-Chair	Lord Clement-Jones	3396	20
Vice Chair	Dawn Butler	1489	27
Vice Chair	Lord Ranger of Northwood	4989	40

The 28 ambiguous officers in `judgment_needed.jsonl` are mostly hereditary-vs-life-peer collisions (Lord Harlech 2677 vs 4928, Viscount Trenchard 2408 vs 1829, Lord Fink vs Lord Finkelstein — real human-judgment cases that the resolver correctly punted on rather than guessing.

29. GOV.UK organisational chart crawl (`scripts/govuk_crawl.py`)

`third_party/govuk/html/orgcharts/extractors/factoids/_index.json` (2026-05-16):

kind	pages
person	646
organisation	624
role	161
past-pm	54
pms-index	1
total	1,486 templated / 1,743 crawled
skipped	256 ("kind not templated"), 1 ("no html")
triples emitted	19,883

The crawler walked the GOV.UK government tree, classified each page by kind, and emitted **Turtle factoids** for known templates.

30. GOV.UK hand-templated factoid extractor — the AI Security Institute

`third_party/govuk/html/orgcharts/extractors/factoids/government__organisations__ai-security-institute/factoids.ttl`:

```
@prefix dcterms: <http://purl.org/dc/terms/> .
@prefix govuk: <https://forgetmenot.local/govuk#> .
@prefix schema1: <http://schema.org/> .

<https://www.gov.uk/government/organisations/ai-security-institute>
  a schema1:GovernmentOrganization, govuk:Organisation ;
  dcterms:isPartOf <https://www.gov.uk/government> ;
  schema1:name "AI Security Institute"@en ;
  schema1:url <https://www.gov.uk/government/organisations/ai-security-institute> .
```

So the executive arm of UK AI policy is captured as RDF, in a named graph keyed by the same URL as the GOV.UK page.

31. GOV.UK RDFa + JSON-LD + microdata extractor

`scripts/govuk_extract_triples.py` runs `pyRdfa` over each page and emits `jsonld.nt`, `rdfa.nt`, `microdata.nt`, plus a combined `triples.nq` (N-Quads named by format). For the AI Security Institute alone:

```
{ "counts": { "jsonld": 24, "rdfa": 14, "microdata": 0 } }
```

A revealing JSON-LD triple from `jsonld.nt`:

```
_ :N006a27763063... <http://schema.org/parentOrganization>
    _ :N46dcca29d35... . # which is ...
_ :N46dcca29d35... <http://schema.org/sameAs>
    <https://www.gov.uk/government/organisations/
    department-for-science-innovation-and-technology> .
```

!AI Security Institute's parent organisation is DSIT — the same answeringBodyId: 216 (Department for Science, Innovation and Technology) that answered Lord Holmes' written question **HL14281** in §9. **The Parliamentary record and the GOV.UK graph now reconcile on a single org.**

32. AI opt-out signals (`sites.mjs`parseAiTxt`, parseNoAi``)

The site crawler also records publisher AI-training opt-out signals — both the `ai.txt` format and `<meta name="no-ai">` directives. From `lib/facilities/sites.mjs`:

```
"we always RECORD the publisher's stance, and only refuse to fetch when the operator passes
strictAiOptOut."
```

It's a defensive design: every MP-website crawl carries an auditable record of whether the publisher objected to AI training, without the crawler unilaterally redacting public political content. (Unit-tested in `tests/unit/ai-optout.test.mjs`.)

33. Site screenshots (`scripts/site-screenshots.mjs``)

`third_party/data/site-shots/20260504T032444Z/index.json` — **40 PNG screenshots** of the public browser demo at `https://fpkg.fly.dev/`, across:

- viewports: mobile (414×896) and desktop (1280×800)
- schemes: dark and light
- routes: home, search-"cooper", party-15, house-commons, member-4514, member-5334 (Allison Gardner — same MP from §22), about, settings

with an aggregate report `.pdf`. So the repo also visually audits its own front-end across light/dark and breakpoints — member -5334 in the route list is, again, the AI APPG Chair.

34. Chrome DevTools MCP server (`.mcp.json``)

`.mcp.json` registers a **studio MCP server** spawning `chrome-devtools-mcp@latest`, which exposes 29 tools (already listed in this session's tool catalogue) covering screenshot, accessibility-tree snapshot, network monitor, performance trace, console capture, Lighthouse audit, navigation, click, form fill, and dialog handling — i.e. **live CDP-level control** of a headless Chrome, intended for auditing the same `fpkg.fly.dev` demo that §33 screenshots. The Parliament APIs are read-only; the MCP server is the matching read-write half for the browser demo.

Threads pulled across Part A + Part B

The cross-source bridges that emerge:

1. Lord Holmes appears in (i) Members API, (ii) MNIS, (iii) DDP SPARQL graph (34bI5Ock), (iv) per-MP member dump members/4294.json, (v) per-MP website crawl sites/4294/, (vi) his own WordPress RSS feed, and (vii) the Wayback Machine — seven corroborating sources for one Bill sponsor.
2. The same DSIT that answers Holmes' AI written question (§9) parents the AI Security Institute in the GOV.UK JSON-LD graph (§31). Parliament's answeringBodyId: 216 and GOV.UK's parentOrganization triple reconcile on a single org.
3. Dr Allison Gardner appears as: (i) MP via Members API (§22), (ii) APPG Chair, resolved via appg resolve to Members id 5334 with confidence score 27 (§28), (iii) per-MP member dump (§24), (iv) GoDaddy-built constituency site with both Atom and RSS feeds (§23), and (v) a route in the browser demo's screenshot battery (§33). The same person is captured five different ways with consistent identity.
4. APPG resolution is 98.7% automatic (§28) — the 28 manual cases are real ambiguities (hereditary vs life peer collisions), not parser failures.
5. The repo's own crawlers detect and respect the things they should: WAFs (§27), robots.txt (§23), AI opt-out signals (§32).
6. 34 enquiries, one Bill, one peer, one Bill-sponsor's LinkedIn, one AI-APPG Chair, one DSIT, one AI Security Institute — all reconciled across Parliament, the per-MP web, GOV.UK's structured data, the Internet Archive, and a live Chrome under MCP control.
